AB An implantable medical device that contains two **coating** layers
 disposed above at least one of its surfaces. The first **coating**
 layer contains a biologically active material; and the second
coating layer contains a polymeric material and nanomagnetic
 material disposed on the first **coating** layer; the second
coating layer is substantially free of the biologically active
 material. The nanomagnetic material has a saturation magnetization of
 from about 2 to about 3000 electromagnetic units per cubic centimeter,
 and it contains nanomagnetic particles with an average particle size of
 less than about 100 nanometers; the average coherence length between
 adjacent nanomagnetic particles is less than 100 nanometers.

AB Methods and apparatus for treatment of vulnerable plaque provide local delivery of one or more plaque stabilizing agents. Delivery of the plaque stabilizing agents described herein stabilize vulnerable plaques at and downstream of an implantation site can reduce the occurrence of rupture of these plaques. An expandable medical device for delivering a therapeutic agent locally to a vulnerable plaque includes an implantable medical device body configured to be implanted within a coronary artery, and a therapeutic dosage of a therapeutic agent for stabilization of vulnerable plaque. The therapeutic agent is affixed in openings in the implantable medical device body in a manner such that the therapeutic agent is released to the vulnerable plaque at a therapeutic dosage and over an administration period effective to stabilize the vulnerable plaque.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB A method and apparatus for the local delivery of therapeutic agents reduces myocardial tissue damage due to ischemia. A local delivery device is used for delivery of the therapeutic agents into a coronary artery which feeds the ischemic myocardial tissue. According to one example, an implantable medical device for delivering insulin locally to myocardial tissue includes a therapeutic dosage of insulin in a biocompatible polymer affixed to a **stent**. The therapeutic dosage of insulin is released from the **stent** at a therapeutic dosage and over an administration period effective to reduce ischemic injury of the myocardial tissue.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB Methods and compositions for treating or preventing inflammatory
diseases such as psoriasis or multiple sclerosis are provided,
comprising the step of delivering to the site of inflammation an
anti-microtubule agent, or analogue or derivative thereof.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.		

AB Devices and methods for reducing, inhibiting, or treating restenosis and hyperplasia after intravascular intervention are provided. In particular, the present invention provides luminal prostheses which allow for controlled release of at least one therapeutic capable agent with increased efficacy to selected locations within a patient's vasculature to reduce restenosis. An intraluminal prosthesis may comprise an expandable structure and a source adjacent the expandable structure for releasing the therapeutic capable agent into a body lumen to reduce smooth muscle cell proliferation.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.
